# 2. Overview

The TecnoLegacy Applicant Tracking System (ATS) Resume Intake and Shortlisting Workflow is designed to establish a structured, controlled, and automation-ready process for managing candidate resumes sourced through external recruitment platforms. The system enables centralized resume intake, layered validation, hierarchical approval, and controlled progression of candidates into interview stages.

The workflow begins with Human Resources (HR) personnel sourcing resumes from external job portals such as Naukri and Indeed. These resumes are manually evaluated against defined Job Descriptions (JD) to ensure initial alignment with required skills, experience levels, and domain relevance. Following preliminary screening, resumes are uploaded into a structured Shared Drive folder hierarchy that segregates recruiter ownership and preserves accountability.

An RPA (Robotic Process Automation) bot continuously monitors designated Input folders within the Shared Drive. Upon detection of newly uploaded resumes, the bot validates document format

compliance (PDF/DOCX), extracts relevant metadata, and transfers structured information into the ATS Dashboard environment. This automation layer ensures systematic ingestion of candidate data while minimizing manual intervention errors.

The Team Lead Dashboard serves as the centralized review interface. Team Leads access a consolidated view of uploaded resumes under a defined section titled “Today’s Uploaded Resumes.” From this interface, the Team Lead performs final validation, applies business judgment, and determines whether the resume should proceed further in the recruitment pipeline. Approved resumes are marked as “Selected” and assigned back to recruiters for telephonic screening and initiation of Round 1 interview discussions. Non-selected resumes are archived within a structured reference repository rather than permanently deleted, thereby preserving potential future candidate value.

The objective of this Process Design Document (PDD) is to document the current operational workflow, system integrations, business rules, decision checkpoints, and exception handling mechanisms. While the current process includes partial manual decision layers, the system architecture has been designed with automation readiness in mind. The workflow supports future enhancements such as AI-based resume scoring, automated duplicate detection, intelligent candidate ranking, and structured interview stage tracking.

This document captures the end-to-end operational design to ensure clarity, governance, audit readiness, and scalability of the ATS workflow.

## 3. Reviewed and Signed off

This document has been prepared for internal review and approval by TecnoLegacy project stakeholders. It represents the current operational model of the ATS Resume Intake and Shortlisting Workflow and serves as a reference for both technical and business validation.

## 4. Current Process Analysis

The current ATS workflow operates as a structured combination of manual sourcing, automation-driven ingestion, and hierarchical approval. The process is intentionally layered to ensure quality control, data integrity, and role-based accountability.

Human Resources personnel are responsible for sourcing candidate resumes from external recruitment platforms such as Naukri and Indeed. At this stage, HR performs a preliminary evaluation of resumes against predefined Job Descriptions (JD). This manual validation ensures that only candidates meeting minimum eligibility criteria proceed into the structured intake system.

Following initial screening, HR uploads shortlisted resumes into a Shared Drive repository. The folder hierarchy is structured as follows:

- ATS (Main Directory)
    - Team Lead
        - HR1
            - Input
        - HR2
            - Input
        - HR3
            - Input

Each recruiter operates within a segregated folder environment to maintain accountability and prevent cross-access between recruiter data sets.

An RPA bot is configured to monitor designated Input folders at scheduled intervals. The automation logic performs the following validations:

- Detection of newly added files
- Validation of acceptable file formats (PDF/DOCX)
- Prevention of unsupported file ingestion
- Extraction of relevant metadata (file name, upload timestamp, recruiter association)

Upon successful validation and ingestion, resume data is transferred into the ATS Dashboard system. The resume status at this stage is recorded as “Applied.”

The Team Lead Dashboard acts as the final screening authority. Upon login, the Team Lead views resumes under a consolidated section labeled “Today’s Uploaded Resumes.” Each resume entry is presented with selection controls allowing single or multiple resume actions. The Team Lead evaluates resumes against organizational standards, job requirements, and strategic hiring needs.

Resumes may be:

- Marked as “Selected” for progression
- Moved to an archival reference folder for future consideration

Resumes are not permanently deleted at rejection stage, thereby preserving institutional candidate data value.

Approved resumes are assigned back to the respective recruiter. The recruiter then initiates telephonic screening and coordinates Round 1 interview progression. This layered approach ensures that no candidate proceeds without final validation by the Team Lead.

The system architecture ensures:

- Controlled visibility
- Role-based access
- Traceability of actions
- Audit monitoring by Admin
- Automation integration readiness

## 5. High Level Description

The ATS Resume Intake and Shortlisting Workflow enables structured candidate processing through a multi-layer validation model supported by automation. The process integrates manual sourcing, automated ingestion, centralized review, and structured recruiter action.

The workflow begins when HR personnel upload shortlisted resumes into their respective Input folders within the Shared Drive. The RPA bot continuously monitors these directories and processes newly added files. Upon successful processing, resumes are displayed within the Team Lead Dashboard.

The Team Lead reviews resumes presented under "Today's Uploaded Resumes" and performs final approval. Approved resumes are marked as "Selected" and assigned back to the respective recruiter for telephonic screening and Round 1 interview initiation. Non-selected resumes are archived for potential future reference.

This structured, rule-driven workflow ensures quality control, reduces candidate processing errors, and establishes a strong foundation for automation and AI-based enhancements in future phases.

**High Level Process Steps :**

1. HR sources resumes from external job portals.
2. HR manually evaluates resumes against defined Job Descriptions.
3. HR uploads shortlisted resumes into recruiter-specific Input folders.
4. RPA bot scans Input folders at configured intervals.
5. RPA validates file format and extracts metadata.
6. Resume data is transferred to ATS Dashboard.
7. Team Lead reviews resumes under "Today's Uploaded Resumes."
8. Team Lead marks resumes as "Selected" or archives for reference.
9. Selected resumes are assigned back to recruiters.
10. Recruiter initiates telephonic screening and Round 1 interview process.

## 6. Detailed Steps

**PROCESS:**

1. HR logs into recruitment platforms and identifies suitable candidate resumes aligned with job requirements.
2. HR performs manual validation to ensure minimum eligibility criteria are satisfied.
3. HR uploads selected resumes into the recruiter-specific Input folder within the Shared Drive hierarchy.
4. The RPA bot scans designated Input folders at predefined intervals.
5. The bot validates document format (PDF/DOCX) and checks file accessibility.
6. Metadata such as recruiter identity, timestamp, and file reference is captured.
7. In case of temporary failure, the RPA executes configured retry attempts before logging exception status.
8. Successfully processed resumes are pushed into the ATS Dashboard environment.
9. Resume status is set to “Applied.”
10. Team Lead logs into the ATS Dashboard.
11. Team Lead accesses “Today’s Uploaded Resumes.”
12. Team Lead reviews resume content and evaluates alignment with organizational hiring standards.
13. Team Lead selects resume via dashboard checkbox control.
14. Resume status is updated to “Selected.”
15. Selected resumes are assigned to the corresponding recruiter.
16. Recruiter receives assignment notification.
17. Recruiter initiates telephonic screening discussion with candidate.
18. Candidate proceeds to Round 1 interview scheduling phase.

## 7. Systems Involved

| System | Used for | User role needed |
|---|---|---|
| Shared Drive | Structured resume storage and Input folder hierarchy | HR Upload Access |
| RPA Bot | Automated resume monitoring, validation, metadata extraction | System Level Configuration |
| ATS Dashboard | Resume review, approval, assignment, and status tracking | Team Lead / Admin |
| Database | User role management, metadata storage, resume status updates | System Managed |
| Admin Monitoring Module | Activity monitoring and permission control | Admin |

## 8. Exceptions

| Exception Details | Corrective Steps | Exception Type |
|---|---|---|
| Unsupported File Format | File rejected by RPA validation logic | Technical Exception |
| Duplicate Resume Upload | Manual identification and archival tagging | Business Exception |
| RPA Processing Failure | Retry mechanism executed; manual review if retries fail | Technical Exception |
| Incorrect Resume Uploaded | Eliminated during Team Lead validation stage | Business Exception |
| System Downtime | Resume processing deferred until service restoration | Technical Exception |

## 9. Assumptions and Risks Involved

**Assumptions:**

- HR personnel upload resumes strictly aligned with defined Job Descriptions.
- Shared Drive infrastructure remains stable and accessible.
- RPA bot operates within defined uptime thresholds.
- Team Leads perform final validation consistently.
- Admin monitors user activity and permissions regularly.

**Risk:**

- Manual screening may introduce subjective evaluation variance.
- Duplicate resumes may be uploaded due to human oversight.
- RPA downtime may delay resume visibility.
- Misconfigured permissions could expose restricted recruiter data.
- Shared Drive latency could impact processing timelines.

Mitigation measures include layered validation, role-based access control, retry mechanisms, and centralized monitoring.

## 10. Confidential Information

All candidate resumes, hiring decisions, workflow logic, and system configurations documented within this PDD are confidential and intended strictly for internal use within TecnoLegacy. Unauthorized distribution, duplication, or disclosure of this document or associated system data is strictly prohibited.

## 11. Glossary

| Term | Description |
|---|---|
| ATS | Applicant Tracking System |
| RPA | Robotic Process Automation |
| TL | Team Lead |
| HR | Human Resources |
| JD | Job Description |
| Metadata | Structured data extracted from resume files |
| Archive Folder | Structured repository for non-selected resumes |
